Software Engineer | Python · Automation · Agentic AI

Summary

Software engineer with 7+ years in Python and Java automation, REST APIs and backend validation across enterprise banking and telecom systems, now building Agentic AI and LLM-powered services.
Built AICredits.in, a multi-provider LLM gateway (integrating the Claude API, OpenAI and more) with 4,500+ users, by directing AI coding agents. I made it dependable with 1,400+ automated tests, a CI/CD pipeline, Grafana cost and usage observability, and billing-leak alerts.
At Iris Software (NAB), I prototyped MCP-compatible agent tooling that executes multi-step API workflows and verifies database state.

Technical Skills

- **AI & LLM:** Agentic AI, MCP (server and client tooling), LLM evaluation (Ragas, DeepEval; coursework), LLM API integration (Claude, OpenAI, Gemini, Bedrock: chat, streaming, tool calling, embeddings), prompt engineering, multi-provider routing, LLM cost and usage governance, RAG (conceptual), Claude Code / Codex workflows
- **Backend & Languages:** Python (automation, REST services), Java, SQL, REST API design (OpenAPI), microservices
- **Built with AI coding agents:** Go, TypeScript, React / Next.js
- **Data & Messaging:** Apache Kafka, Avro schemas / contract testing, Apache Airflow, Parquet
- **Databases:** PostgreSQL (incl. pgvector), Redis, MongoDB, MySQL, Oracle
- **CI/CD & Infrastructure:** CI/CD pipelines (GitHub Actions, GitLab CI, Jenkins), Docker, Docker Compose, Kubernetes / OpenShift (kubectl), Linux, Traefik
- **Observability:** Prometheus, Grafana, Loki, Alertmanager
- **Test Automation & Reliability:** test automation frameworks, regression and integration test suites (1,400+ automated tests, Pytest), API contract testing, distributed-system validation, performance testing (JMeter), root-cause analysis

Projects

AICredits.in — LLM API Gateway · Jan 2026 – Present

Built by directing AI coding agents (Claude Code, Codex); I own the requirements, review, testing, operations and cost. Maintained part-time, a few hours a week.

- Delivered a working multi-provider LLM gateway exposing OpenAI-compatible (Chat Completions, Responses, embeddings, image, audio) and Anthropic Messages APIs, translating requests across provider formats with streaming (SSE) and tool/function calling support, plus a production MCP server for AI clients, user dashboard and admin console; built through AI-agent-driven development on a Go backend with a Next.js/React front end.
- **Making AI-written code trustworthy:** 1,400+ automated tests, a **GitHub Actions CI/CD pipeline** (Go tests, frontend and admin lint/typecheck/build, and an integration job against Postgres and Redis on every push and PR to `main`), a regression test for every production bug (including a replay of the real failing request), and manual, SHA-pinned deploys with a pre-deploy billing smoke test and health-check gating.
- **Billing correctness & monitoring:** automated alerts for billing discrepancies (requests completed but billed at zero, delivered-but-unbilled responses, zero-cost fallbacks); found and fixed two real billing defects (a double-deduction and token overbilling) in production.
- **Usage observability (Grafana):** 14 dashboards, ~50 custom Prometheus metrics and 22 alert rules covering requests, tokens, latency, errors, cost and margin by provider, model and user, with a per-request record and credit ledger so any charge can be traced and reconciled.
- **Processes for agents to work well:** a project permission policy, reusable skills, and a read-only observability CLI so agents can triage production issues safely; I approve and deploy every change.
- **Cost and usage control for cloud LLM APIs:** fallback routing and retries across providers; per-key and per-user spend budgets, rate limits and model allow-lists to cap runaway usage; correct cached-token pricing.
- **Reliability & security:** health and readiness checks, graceful shutdown that flushes in-flight billing batches, daily database backups with a streaming hot standby, scoped API and management keys, and production config validation with secret scrubbing in logs.

Also built MasterPrompting.net, a free prompt-engineering learning platform grounded in official OpenAI and Anthropic documentation.

Professional Experience

Iris Software Pvt. Ltd. — Client: National Australia Bank (NAB)

Senior Software Development Engineer in Test | Jul 2025 – Present

- Designed and built an **Agentic AI tooling proof of concept (MCP-compatible)** in a test environment, enabling LLM agents to execute multi-step API workflows, verify database state, generate test cases from technical specifications and extract engineering artifacts.
- Prototyped LLM workflows that analyse enterprise codebases to surface likely fault locations and error context for developers.
- Built an **Avro-based contract-testing framework** validating microservice integrations and backward compatibility.
- Automated Kafka schema and event verification across distributed services.
- Validated Apache Airflow / Parquet pipelines delivering to Kafka topics and databases; delivered Java (Gradle) and SQL-driven backend verification integrated into CI.

Orange Business Services — Gurugram, India

System Software Engineer | Sep 2022 – Jul 2025

- Built and owned Python automation platforms (Pytest, Requests, Selenium) covering REST API, UI and backend validation for distributed microservices, integrated into GitLab CI/CD pipelines.
- Designed REST API and backend validation against MongoDB and SQL; ran JMeter performance suites that surfaced API bottlenecks and thread contention.
- Dockerized the platform for portable execution; worked with DevOps to stabilise CI/CD and reduce flaky tests.
- Integrated Prometheus APIs and monitored service health in Grafana; deployed and operated services on OpenShift (cron, log analysis, troubleshooting).
- Automated daily production verification (30+ minutes saved per day); mentored 4+ junior engineers.

Comviva Technologies (Tech Mahindra) — Gurugram, India

Software Development Engineer in Test | Sep 2019 – Sep 2022

- Automated 195+ Appium test cases, cutting manual regression time by 50%+; built reusable Java modules and JMeter API load tests.
- Resolved 490+ defects across releases of financial mobile applications; Oracle SQL backend validation.
- Selected for on-site delivery on the Qatar National Bank (QNB) engagement.

Certifications

- **Building with the Claude API** — Anthropic (May 2026)
- **Claude Code in Action** — Anthropic (Mar 2026)
- GenAI with Python — ChaiCode (Nov 2025)
- Prompt Design in Vertex AI — Google Cloud (Apr 2025)
- ISTQB Foundation Level (2019)

Education

- **MCA** — Indira Gandhi National Open University (2019–2023)
- **BCA** — Jagannath International Management School, New Delhi (2016–2019)
